Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Bill Wypler

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Heather Gordon

Dear WY Game and Fish,

Elk should not be fed in food lots, like cattle. Chronic wasting disease and other diseases are too much of a threat in this kind of setting. I am a hunter and believe that elk need to be managed for their benefit and not for ours - hunters, like me, in particular! Thank you for reading this message.

The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Jason Nardell

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. Dear WY Game and Fish,

I lived in California most of my life and was concerned about and interested in the issues we faced as coyotes adapted to urban lifestyles. I attended a program specifically on how to adapt to coyotes and options livestock farmers could use to slow down and/or eliminate the damages caused by coyotes, while still allowing them to live in San Francisco and in semi-rural areas. I mention this as I think it's critical that we carefully examine options for keeping both wild and domesticated healthy and safe, most especially as our climate is rapidly changing, which will cause further impacts to wild animals.

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic

wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate

responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Amy Kahle

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Eric Neuman

The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Cathy Anderson

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. Dear WY Game and Fish,

Resort to necessary winter feeding only when absolutely needed to prevent die-off due to inaccessible feed during severe winter conditions causing starvation.

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Rochelle Gravance

The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Penny Holmes

Dear WY Game and Fish,

It is imperative that we save and protect all Elk throughout the Rocky Mountain Region.

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Kathleen Doyle

Dear WY Game and Fish,

BAN pesticides! BAN glue traps! BAN herbicides! BAN rodenticides! BAN all animal testing!

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. Dear WY Game and Fish,

I am an outdoorsman - a backpacker, cross country skier and hiker - who spends a lot of time in the Greater Yellowstone Ecoregion. One of the privileges of living in the region and being able to access its wilderness areas and parks is the opportunity to see wildlife in their native free-range habitat. Elk feed lots, like that near Jackson WY, do not constitute native free-range habitat. Thus, I urge you to discontinue the practice. Thank you.

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Michael Smith

Dear WY Game and Fish,

Help create a safe natural habitat for the elk!

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Kevin Richeson

Dear WY Game and Fish,

I was born and grew up in Wyoming and hunted elk, deer, and antelope there until I moved to Idaho. I always felt it was best for any animal to winter in their natural manner and habitats. I know this would be a big change from the present feeding grounds, I think it would be the best approach to let them go natural.

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. Dear WY Game and Fish,

Wyoming is a hunting state (so I thought) I guess I could be wrong. I am also an animal/environmental activist for 40+ years. I have always been friends with hunters who eat all they kill and understand why we must have limits. This problem you have now is unacceptable disgusting really if you choose to not do what is healthy for a magnificent animal. It also would make me sick if Wyoming was choosing to make money off wealthy idiots who have absolutely no appreciation for what Wyoming has to offer and the type of country it is. Please do what is right for the residents of your state, all of them. They we're here before you and the Elk deserve life as much as all other life there. Choose to preserve all of your state not just the profitable life. Thank you

I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Pam Bixter

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Heidi Juhl

Dear WY Game and Fish,

I live in Colorado and we have a HUGE elk population with NO feedlots required !

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Lisha Doucet

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. I strongly believe elk feedgrounds should not play a role in elk management in the future.

I am very concerned about the risk that declining elk herds and consequent disruption to all other wildlife in the region poses to regional tourism, wildlife watching, outdoor recreation, and hunting economies.

Effective strategies currently exist to minimize conflicts between wildlife and livestock. Wyoming should investigate responsible alternatives and adopt strategies that surrounding western states (Colorado, Montana, Idaho, Utah) use to deal with these issues without resorting to winter feeding.

I urge you to include solid plans for rapid phase-out of artificial winter feeding as an essential part of the solution to control the spread of chronic wasting disease, before it's too late.

Sincerely,

Tanya Piker

Dear WY Game and Fish,

I appreciate the abundant wildlife of the Greater Yellowstone Ecoregion, including elk, and the more I hear about chronic wasting disease, the more concerned I am by its rapid spread, especially in Wyoming. I fear for the future of elk herds in northwestern Wyoming if chronic wasting disease gets established and quickly spreads through elk herds on winter feedgrounds. The only way to prevent this disastrous outcome is to stop artificially feeding elk in winter. I strongly urge the WGFD to include immediate phase-out of these feedlots in your elk feedground management plan.

While I'm most concerned about the threat of a chronic wasting disease epidemic, ending artificial feeding will also help reduce brucellosis and other terrible diseases that afflict elk on feedgrounds, benefitting both elk and cattle ranchers. To: WGF-ELKFEEDGROUNDINFO <wgf-elkfeedgroundinfo@wyo.gov>

Good afternoon,

This thread is an example of the numerous emails we have received to the wgf contact email address regarding elk feedgrounds. So far, including these three, we have received 248 emails. The senders seem to all be part of a mailing list

and the form is generally the same with occasional variations. I will send all the comments once the emails have finished coming in, but for now this is a sample of the sentiment. If anyone has any questions please feel free to reach out.

Thanks,
Stephanie Estell
